

## PROCESS FOR THE PREPARATION OF PHENYLALANINE ENAMIDE DERIVATIVES

5 The present invention relates to processes and intermediates for the synthesis of a class of phenylalanine enamide derivatives, the final products being useful as  $\alpha 4$  integrin inhibitors.

10 The role of  $\alpha 4$  integrin inhibitors, such as  $\alpha 4\beta 7$  and/or  $\alpha 4\beta 1$  inhibitors, for use in medicine is discussed, for example, in International Patent Application Number WO 02/069393.

15 We have now developed a process for the production of a class of  $\alpha 4$  integrin inhibitors, as defined hereinafter, which is particularly amenable for the large scale synthesis of the compounds. The process is simple to operate and advantageously limits the need to use protecting groups.

Thus according to one aspect of the invention we provide a process for the preparation of phenylalanine enamide derivatives of the general formula (1):

20 wherein:

Ar<sup>1</sup> is an optionally substituted aromatic or heteroaromatic group;

L<sup>2</sup> is a linker group selected from -N(R<sup>4</sup>)- [where R<sup>4</sup> is a hydrogen atom or an optionally substituted straight or branched C<sub>1-6</sub>alkyl group], -CON(R<sup>4</sup>)-, or -S(O)<sub>2</sub>N(R<sup>4</sup>)-;

25 R<sup>1</sup> is a carboxylic acid (-CO<sub>2</sub>H) or a derivative or biostere thereof;

R<sup>2</sup> is a hydrogen atom or a C<sub>1-6</sub>alkyl group;

R<sup>x</sup>, R<sup>y</sup> and R<sup>z</sup> which may be the same or different is each an atom or group -L<sup>1</sup>(Alk<sup>1</sup>)<sub>n</sub>(R<sup>3</sup>)<sub>v</sub> in which L<sup>1</sup> is a covalent bond or a linker atom or group, Alk<sup>1</sup> is an optionally substituted aliphatic or heteroaliphatic chain, R<sup>3</sup> is a hydrogen or

halogen atom or group selected from  $-OR^{3a}$  [where  $R^{3a}$  is a hydrogen atom or an optionally substituted straight or branched  $C_{1-6}$ alkyl group or  $C_{3-8}$ cycloalkyl group],  $-SR^{3a}$ ,  $-CN$  or an optionally substituted cycloaliphatic, heterocycloaliphatic, polycycloaliphatic, heteropolycycloaliphatic, aromatic or heteroaromatic group,  $n$  is zero or the integer 1 and  $v$  is the integer 1, 2 or 3 provided that when  $n$  is zero and  $L^1$  is a covalent bond  $v$  is the integer 1; or  $R^z$  is an atom or group as previously defined and  $R^x$  and  $R^y$  are joined together to form an optionally substituted spiro linked cycloaliphatic or heterocycloaliphatic group;

which comprises reacting a compound of formula (2):

wherein:

$Q^a$  is a group  $-N(R^4)H$ ;

and the salts, solvates, hydrates and N-oxides thereof;

with a compound  $Ar^1W$  wherein  $W$  is a group selected from  $X^1$  (wherein  $X^1$  is a leaving atom or group such as a halogen atom, e.g. a fluorine, bromine, iodine or chlorine atom or a sulfonyloxy group such as an alkylsulfonyloxy, e.g. trifluoro-methylsulfonyloxy or arylsulfonyloxy, e.g. p-toluenesulfonyloxy group),  $-COX^2$  (wherein  $X^2$  is a halogen atom such as a chlorine atom or a  $-OH$  group) or  $-SO_2X^3$  (in which  $X^3$  is a halogen atom such as chlorine).

It will be appreciated that compounds of formulae (1), (2) or  $Ar^1W$  may have one or more chiral centres, and exist as enantiomers or diastereomers. The process is to be understood to extend to all such enantiomers, diastereomers and mixtures thereof, including racemates. Formulae (1), (2) or  $Ar^1W$  and the formulae hereinafter are intended to represent all individual isomers and

mixtures thereof, unless stated or shown otherwise. In addition, compounds of formulae (1), (2) or Ar<sup>1</sup>W may exist as tautomers, for example keto (CH<sub>2</sub>C=O)-enol (CH=CHOH) tautomers. Formulae (1), (2) or Ar<sup>1</sup>W and the formulae hereinafter are intended to represent all individual tautomers and mixtures thereof, unless stated otherwise.

In the compounds described herein optionally substituted aromatic groups which may be represented by the group Ar<sup>1</sup> include for example optionally substituted monocyclic or bicyclic fused ring C<sub>6-12</sub>aromatic groups, such as phenyl, 1- or 2-naphthyl, 1- or 2-tetrahydronaphthyl, indanyl or indenyl groups.

- 5 Each aromatic or heteroaromatic group represented by the group Ar<sup>1</sup> may be optionally substituted on any available carbon or, when present, nitrogen atom. One, two, three or more of the same or different substituents may be present and each substituent may be selected for example from an atom or group -L<sup>3</sup>(Alk<sup>2</sup>)<sub>t</sub>L<sup>4</sup>(R<sup>5</sup>)<sub>u</sub> in which L<sup>3</sup> and L<sup>4</sup>, which may be the same or
- 10 different, is each a covalent bond or a linker atom or group, t is zero or the integer 1, u is an integer 1, 2 or 3, Alk<sup>2</sup> is an optionally substituted aliphatic or heteroaliphatic chain and R<sup>5</sup> is a hydrogen or halogen atom or a group selected from optionally substituted C<sub>1-6</sub>alkyl or C<sub>3-8</sub>cycloalkyl, -OR<sup>6</sup> [where R<sup>6</sup> is a hydrogen atom, an optionally substituted C<sub>1-6</sub>alkyl or C<sub>3-8</sub>cycloalkyl

- 20 8cycloalkyl group], -N(R<sup>6</sup>)CSN(R<sup>7</sup>)(R<sup>8</sup>) or -N(R<sup>6</sup>)SO<sub>2</sub>N(R<sup>7</sup>)(R<sup>8</sup>), provided that when t is zero and each of L<sup>3</sup> and L<sup>4</sup> is a covalent bond then u is the integer 1 and R<sup>5</sup> is other than a hydrogen atom.

- When L<sup>3</sup> and/or L<sup>4</sup> is present in these substituents as a linker atom or group it
- 25 may be any divalent linking atom or group. Particular examples include -O- or -S- atoms or -C(O)-, -C(O)O-, -OC(O)-, -C(S)-, -S(O)-, -S(O)<sub>2</sub>-, -N(R<sup>8</sup>)- [where R<sup>8</sup> is a hydrogen atom or an optionally substituted straight or branched C<sub>1-6</sub>alkyl group], -CON(R<sup>8</sup>)-, -OC(O)N(R<sup>8</sup>)-, -CSN(R<sup>8</sup>)-, -N(R<sup>8</sup>)CO-, -N(R<sup>8</sup>)C(O)O-, -N(R<sup>8</sup>)CS-, -S(O)<sub>2</sub>N(R<sup>8</sup>)-, -N(R<sup>8</sup>)S(O)<sub>2</sub>-, -N(R<sup>8</sup>)O-, -ON(R<sup>8</sup>)-, -
- 30 N(R<sup>8</sup>)N(R<sup>8</sup>)-, -N(R<sup>8</sup>)CON(R<sup>8</sup>)-, -N(R<sup>8</sup>)CSN(R<sup>8</sup>)-, or -N(R<sup>8</sup>)SO<sub>2</sub>N(R<sup>8</sup>)- groups.

When the groups R<sup>6</sup> and R<sup>7</sup> or R<sup>7</sup> and R<sup>8</sup> are both C<sub>1-6</sub>alkyl groups these  
15 groups may be joined, together with the N atom to which they are attached, to form a heterocyclic ring. Such heterocyclic rings may be optionally interrupted by a further heteroatom selected from -O-, -S- or -N(R<sup>6</sup>)-. Particular examples of such heterocyclic rings include piperidinyl, morpholinyl, thiomorpholinyl, pyrrolidinyl, imidazolidinyl and piperazinyl rings.

20

Examples of the substituents represented by -L<sup>3</sup>(Alk<sup>2</sup>)<sub>t</sub>L<sup>4</sup>(R<sup>5</sup>)<sub>u</sub> when present  
in Ar<sup>1</sup> groups in compounds of formulae (1) or (iii) include atoms or groups -  
30 L<sup>3</sup>Alk<sup>2</sup>L<sup>4</sup>R<sup>5</sup>, -L<sup>3</sup>Alk<sup>2</sup>R<sup>5</sup>, -L<sup>3</sup>R<sup>5</sup>, -R<sup>5</sup> and -Alk<sup>2</sup>R<sup>5</sup> wherein L<sup>3</sup>, Alk<sup>2</sup>, L<sup>4</sup> and R<sup>5</sup> are as defined above. Particular examples of such substituents include -

 carboxylic acid ester or an amide. Particular acyclic esters and amides include  
 30 -CO<sub>2</sub>Alk<sup>7</sup> and -CONR<sup>6</sup>R<sup>7</sup> groups as defined herein. When R<sup>1</sup> is a biostere of

Optional  
5 substituents present on the Alk<sup>7</sup> group include R<sup>13a</sup> substituents described below.

It will be appreciated that in the forgoing list of Alk<sup>7</sup> groups the point of attachment to the remainder of the compounds of formulae (1) or (2) is via the  
10 last described part of the Alk<sup>7</sup> group. Thus, for example a methoxyethyl group would be attached by the ethyl group, whilst a morpholinyl-N-ethyl group would be attached via the N-ethyl group.

It will be further appreciated that in the forgoing list of Alk<sup>7</sup> groups, where not  
15 specifically mentioned, alkyl groups may be replaced by alkenyl or alkynyl groups where such groups are as previously defined for Alk<sup>1</sup>. Additionally these alkyl, alkenyl or alkynyl groups may optionally be interrupted by one, two or three linker atoms or groups where such linker atoms and groups are as previously defined for L<sup>3</sup>.

Further, prodrugs of compounds of formula (1) which may be prepared using the process of the invention include cyclic esters where X is a –N(R<sup>2</sup>)– group in which R<sup>2</sup> becomes a C<sub>1-6</sub>alkyl joining chain, especially a –CH<sub>2</sub>– or –CH<sub>2</sub>CH<sub>2</sub>– chain, which is also connected to the acid group R<sup>1</sup> to form a cyclic ester of formula (1a):  
25

When present in the group R<sup>x</sup>, R<sup>y</sup> and/or R<sup>z</sup> in compounds of formulae (1) or (2) the linker atom or group represented by L<sup>1</sup> may be any linker atom or group as described above for the linker atom or group L<sup>3</sup>. In addition L<sup>1</sup> may also be a -Se- atom.

5

When Alk<sup>1</sup> is present in the group R<sup>x</sup>, R<sup>y</sup> and/or R<sup>z</sup> in compounds of formulae (1) or (2) as an optionally substituted aliphatic chain it may be an optionally substituted C<sub>1-10</sub>aliphatic chain. Particular examples include optionally substituted straight or branched chain C<sub>1-6</sub>alkylene, C<sub>2-6</sub>alkenylene or C<sub>2-6</sub>alkynylene chains.

15 formula (1) by any carbon or hetero e.g. nitrogen atom as appropriate.

- 25        Compounds of formulae (1), (1b), (1c), (1d) and (1e) are potent and selective inhibitors of  $\alpha_4$  integrins. The compounds are of use in modulating cell adhesion and in particular are of use in the prophylaxis and treatment of diseases or disorders including inflammation in which the extravasation of leukocytes plays a role. Diseases or disorders of this type include inflammatory arthritis such as rheumatoid arthritis vasculitis or  
30        polydermatomyositis, multiple sclerosis, allograft rejection, diabetes, inflammatory dermatoses such as psoriasis or dermatitis, asthma and inflammatory bowel disease. The use and formulation of the compounds is

more particularly described in our co-pending International Patent Application PCT/GB 02/00206.

5 For convenience the description hereinafter refers to the preparation of a compound of formula (1) but clearly the description applies equally to the preparation of compounds of formulae (1b), (1c), (1d) and (1e).

10 Thus in the process of the invention a substituted 4-aminophenylalanine of formula (2) is reacted with a compound  $\text{Ar}^1\text{W}$  to give a compound of formula (1). Suitable conditions for this reaction depend upon the nature of the group W.

15 Thus when W is the group  $\text{X}^1$  the reaction may be carried out in the presence of an acid, such as a Bronsted acid e.g. hydrogen chloride. The acid may be generated in situ as a reaction by-product or may be added at the start of the reaction as an initiator e.g. catalytic amount of hydrogen chloride. The reaction may be performed in a variety of solvents such as alcohols e.g. ethanol, ethers e.g. tetrahydrofuran, 2-methoxyethyl ether, 1,4-dioxane, acetic acid, water, acetonitrile, substituted amides such as N,N-dimethylformamide or acetates e.g. ethyl acetate.

In one particular aspect of the process  $\text{X}^1$  is a halogen atom, especially a chlorine or bromine atom.

25 Compounds of formula  $\text{Ar}^1\text{X}^1$  may be prepared from alcohols of formula  $\text{Ar}^1\text{OH}$  using methods known to those skilled in the art e.g. by reaction with a halogenating agent, for example a phosphorous oxyhalide such as phosphorous oxychloride at an elevated temperature e.g.  $110^\circ\text{C}$  or by reaction with hydrogen halide e.g. hydrogen bromide.

30

Intermediates of formulae  $\text{Ar}^1\text{OH}$  or  $\text{Ar}^1\text{X}^1$  may be prepared using methods as described in co-pending International Patent Application Number WO 02/069393.

When in the process of the invention W is the group  $-\text{COX}^2$  and  $\text{X}^2$  is a halogen atom such as a chlorine atom the reaction may be performed in the presence of a base, such as a hydride, e.g. sodium hydride or an amine, e.g. triethylamine or N-methylmorpholine, in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane or carbon tetrachloride or a dipolar aprotic solvent such as an amide, e.g. dimethylformamide or an ether, e.g. a cyclic ether such as tetrahydrofuran or an ester e.g. ethyl acetate at for example ambient temperature. The acid chlorides  $\text{Ar}^1\text{COCl}$  may be prepared from the corresponding acid using methods known to those skilled in the art.

Alternatively, the acylation may be carried out under the same conditions with an acid (i.e. where  $\text{X}^2$  is  $-\text{OH}$ ) in the presence of a condensing agent, for example a diimide such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide or N,N'-dicyclohexylcarbodiimide, advantageously in the presence of a catalyst such as a N-hydroxy compound e.g. a N-hydroxytriazole such as 1-hydroxybenzotriazole. Alternatively the acid may be reacted with a chloroformate, for example ethylchloroformate, prior to the desired acylation reaction.

It will be appreciated by those skilled in the art that acid groups may also be activated by the formation of a reactive ester e.g. ethyl or p-nitrophenyl ester.

Alternatively when in the process of the invention W is the group  $-\text{SO}_2\text{X}^3$  the reaction may be performed in the presence of a base, such as a hydride, e.g. sodium hydride or an amine, e.g. triethylamine or N-methylmorpholine, in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane or carbon tetrachloride or an amide, e.g. dimethylformamide or an ether, e.g. a cyclic ether such as tetrahydrofuran, at for example ambient temperature.

Intermediate compounds of formula (2) are novel and form a further aspect of the invention.

One particularly useful compound of formula (2) for use in the process is:

3-(4-aminophenyl)-2(S)-(3-oxo-7-oxaspiro[3.5]non-1-en-1-ylamino)-propionic acid hydroxyethyl ester.

In a further aspect of the invention intermediates of formula (2) may be prepared by reduction of a compound of formula (4):

wherein  $R^1$ ,  $R^2$ ,  $R^x$ ,  $R^y$  and  $R^z$  are as herein defined.

Suitable conditions may involve catalytic hydrogenation using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such as carbon in a solvent such as an ether, e.g. tetrahydrofuran or an alcohol e.g. methanol or ethanol or an ester e.g. ethyl acetate. The reaction may be performed at atmospheric pressure or up to a pressure of 10 Bar. Alternatively chemical reduction using for example a metal, e.g. tin or iron, in the presence of an acid such as hydrochloric acid may be employed. The amine thus formed may be alkylated using conditions known to those skilled in the art to give a compound of formula (2) wherein  $R^4$  is an optionally substituted straight or branched  $C_{1-6}$  alkyl group.

Intermediate compounds of formula (4) are novel and form a further aspect of the invention.

One particularly useful compound of formula (4) for use in the process is:  
3-(4-nitrophenyl)-2(S)-(3-oxo-7-oxaspiro[3.5]non-1-en-1-ylamino)propionic acid hydroxyethyl ester.

Thus according to a further aspect of the invention intermediates of formula (4) may be prepared by reaction of a compound of formula (5):

wherein  $R^1$  and  $R^2$  are as herein defined;  
with a compound of formula (6a) or (6b):

- 5    wherein  $R_x$ ,  $R_y$  and  $R_z$  are as herein defined and  $R^a$  represents a  $C_{1-6}$ alkyl group or a silyl group. Particular silyl groups include alkylsilyl groups such as a *t*butyldimethylsilyl or trimethylsilyl group.

- 10    The reaction may be performed in an inert solvent or mixture of solvents, for example a hydrocarbon such as an aromatic hydrocarbon e.g. benzene or toluene, a halogenated hydrocarbon such as 1,2-dichloroethane, or dichloromethane, or an ester e.g. ethyl acetate at a temperature from 0°C to the reflux temperature. Where necessary, for example when a salt of an amine of formula (5) is used, an organic base such as diisopropylethylamine
- 15    or triethylamine may be added.

Intermediates of formulae (6a) or (6b) may be prepared using methods as described in International Patent Application Number WO 02/069393.

- 20    It will be appreciated that intermediates of formula (5) where not commercially available may be prepared using methods known to those skilled in the art. For example intermediates of formula (5) in which  $R^1$  is a  $-\text{CO}_2\text{Alk}^7$  group may be prepared by esterification of the corresponding amino acid.

- 25    In one aspect of the process  $R^1$  is especially the group  $-\text{CO}_2\text{Alk}^7$ .

In another aspect of the process  $R^4$  is especially a hydrogen atom.

It will be appreciated that intermediates, such as intermediate  $Ar^1W$ , (5), (6a) or (6b), if not available commercially, may also be prepared by methods known to those skilled in the art following procedures set forth in references such as Rodd's Chemistry of Carbon Compounds, Volumes 1-15 and Supplementals (Elsevier Science Publishers, 1989), Fieser and Fieser's Reagents for Organic Synthesis, Volumes 1-19 (John Wiley and Sons, 1999), Comprehensive Heterocyclic Chemistry, Ed. Katritzky et al, Volumes 1-8, 1984 and Volumes 1-11, 1994 (Pergamon), Comprehensive Organic Functional Group Transformations, Ed. Katritzky et al, Volumes 1-7, 1995 (Pergamon), Comprehensive Organic Synthesis, Ed. Trost and Fleming, Volumes 1-9, (Pergamon, 1991), Encyclopedia of Reagents for Organic Synthesis Ed. Paquette, Volumes 1-8 (John Wiley and Sons, 1995), Larock's Comprehensive Organic Transformations (VCH Publishers Inc., 1989) and March's Advanced Organic Chemistry (John Wiley and Sons, 1992).

Where desired the process according to the invention may be extended by optionally employing one or more subsequent reactions to convert a compound of formula (1) to a further compound of formula (1) as described hereinafter.

Further, compounds of formula (1) in which  $R^Z$  is a halogen atom may be obtained from compounds of formula (1) in which  $R^Z$  is a hydrogen atom by reaction with a halogen source such as bromine or a halosuccinamide e.g. chloro or bromosuccinamide. The reaction may be performed in a solvent such as an ether e.g. a cyclic ether such as tetrahydrofuran or an ester e.g. ethyl acetate at a temperature from about  $0^\circ$  to  $30^\circ$ . When bromine is used as halogen source the reaction may optionally be performed in the presence of added base such as an amine e.g. triethylamine in the presence of a halogenated hydrocarbon e.g. dichloromethane.

Further, compounds of formula (1) in which  $R^Z$  is a group  $-L^1(Alk^1)_n(R^3)_v$  in which  $L^1$  is for example a Se, S, O or N( $R^8$ ) may be prepared by reaction of an intermediate of formula  $HL^1(Alk^1)_n(R^3)_v$  with a compound of formula (1) in which  $R^Z$  is a hydrogen atom. The reaction may be performed in an organic solvent such as an ether e.g. a cyclic ether such as tetrahydrofuran at around room temperature optionally in the presence of a base such as an amine e.g. triethylamine. When  $R^Z$  is the group  $-S(Alk^1)_n$  the reaction may be achieved using a compound of formula  $-HalS(Alk^1)_n$  where Hal is a halogen atom, for example, chlorine.

It will be appreciated by one skilled in the art that the group  $R^Z$  may also be derivatised, for example as described above, in intermediates preceding the compounds of formula (1).

Further the compounds of formula (1) which contain the group  $Alk^7$  may be interconverted to give acids or further derivatives (e.g. esters) or biosteres of formula (1).

Thus the process may be used to obtain a compound of formula (1) in which  $R^1$  is a  $-CO_2H$  group by hydrolysis of an ester of formula (1) wherein  $R^1$  is the group  $-CO_2Alk^7$ . The hydrolysis may be performed using either an acid or a base depending on the nature of  $Alk^7$ , for example an organic acid such as trifluoroacetic acid or an inorganic base such as lithium, sodium or potassium hydroxide optionally in an aqueous organic solvent such as an amide e.g. a substituted amide such as dimethylformamide, an ether e.g. a cyclic ether such as tetrahydrofuran or dioxane or an alcohol e.g. methanol at a temperature from ambient to the reflux temperature. Where desired, mixtures of such solvents may be used. The acids thus formed may then be further derivatised, for example by esterification, using standard methods known to those skilled in the art, such as reaction with an alcohol of formula  $-HOAlk^7$  in the presence of an acid catalyst e.g. p-toluenesulfonic acid. Alternatively a condensing agent, for example a diimide such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide or N,N'-dicyclohexylcarbodiimide, may be employed,

advantageously in the presence of a catalyst such as a N-hydroxy compound e.g. a N-hydroxytriazole such as 1-hydroxybenzotriazole. Alternatively an ester of formula (1) may undergo transesterification, preferably in the presence of an acid catalyst, to give another ester of formula (1).

5

In the above processes, compounds containing a basic centre may be isolated and/or crystallised by the formation of a salt, which may offer an improvement in purity. Suitable salts include, but are not limited to oxalate or di-p-toluoyl-D-tartrate.

10

It will be appreciated that the compounds of formula (1), such as those as formed in the process as defined herein, or any preceding intermediates may be further derivatised by one or more standard synthetic methods employing substitution, oxidation, reduction or cleavage reactions. Particular substitution approaches include conventional alkylation, arylation, heteroarylation, acylation, thioacylation, halogenation, sulphonylation, nitration, formylation and coupling procedures. It will be appreciated that these methods may also be used to obtain or modify other compounds of any of formula (1) or any preceding intermediates where appropriate functional groups exist in these compounds.

20

N-oxides of compounds of formula (1) may be prepared for example by oxidation of the corresponding nitrogen base using an oxidising agent such as hydrogen peroxide in the presence of an acid such as acetic acid, at an elevated temperature, for example around 70°C to 80°C, or alternatively by reaction with a peracid such as peracetic acid in a solvent, e.g. dichloromethane, at ambient temperature.

25

Salts of compounds of formula (1) may be prepared by reaction of a compound of formula (1) with an appropriate base in a suitable solvent or mixture of solvents e.g. an organic solvent such as an ether e.g. diethylether, or an alcohol, e.g. ethanol using conventional procedures.

30

Where it is desired to obtain a particular enantiomer of a compound of formula (1) this may be produced from a corresponding mixture of enantiomers using any suitable conventional procedure for resolving enantiomers.

- 5 Thus for example diastereomeric derivatives, e.g. salts, may be produced by reaction of a mixture of enantiomers of formula (1) e.g. a racemate, and an appropriate chiral compound, e.g. a chiral base. The diastereomers may then be separated by any convenient means, for example by crystallisation and the desired enantiomer recovered, e.g. by treatment with an acid in the instance  
10 where the diastereomer is a salt.

- In another resolution process a racemate of formula (1) may be separated using chiral High Performance Liquid Chromatography. Alternatively, if desired a particular enantiomer may be obtained by using an appropriate  
15 chiral intermediate in one of the processes of the invention described above. Alternatively, a particular enantiomer may be obtained by performing an enantiomer specific enzymatic biotransformation e.g. an ester hydrolysis using an esterase and then purifying only the enantiomerically pure hydrolysed acid from the unreacted ester antipode.

- 20 Chromatography, recrystallisation and other conventional separation procedures may also be used with intermediates or final products where it is desired to obtain a particular geometric isomer of the invention.

All Intermediates and Examples were named with the aid of Beilstein Autonom

- 30 4-nitro-(L)-phenylalanine ethyl ester hydrochloride salt (100g) was suspended in ethyl acetate (590 mL) and washed with 16.5% potassium carbonate solution (150 mL) at 25-30°C, followed by saturated brine (70 mL). The organic layer was then charged over 10 minutes to a slurry of

The solution was cooled to 20°C and triethylamine (5.93 g) added. The turbid solution was then filtered, washing with ethanol (10 ml) and a solution of oxalic acid (4.62 g) in ethanol (15 ml) added followed by seeds of Intermediate 5 oxalate salt. Intermediate 5 (24.3 g) and Intermediate 9 (45.8g) were suspended in ethanol (300 mL) and heated to 60°C for 4 h, under nitrogen. Ethanol was removed *in vacuo* and the residue taken up in ethyl acetate (350 mL). ##### **Method A**

A stirred solution of the compound of Example 7 (300mg, 0.637mmol) and triethylamine (1.2eq, 100μl) in THF (10ml) at 0° was treated dropwise with a solution of bromine in DCM (2% v/v, 2.1ml, 1.2eq). After 12h the reaction was diluted with DCM (50ml) and washed successively with saturated aqueous NaHCO<sub>3</sub>, dried (MgSO<sub>4</sub>) filtered and concentrated *in vacuo*. The residual foam was triturated with diisopropylether and the resulting solid collected and

dried *in vacuo* to give the title compound as a pale yellow powder (0.45mmol, 76%).

#### **Method B**

A suspension of Example 6a (250 g) in ethyl acetate (1500 mL) was stirred  
5 with 10% aqueous potassium carbonate (545 mL) to give an organic solution  
of Example 7. The latter was washed with water (250 mL) and 15% brine (250  
mL) then cooled to  $-10^{\circ}\text{C}$  in the reaction vessel. N-Bromosuccinimide (51.4 g)  
was added portionwise to the solution over 1 h at  $-10$  to  $-5^{\circ}\text{C}$ . Once all the  
reagent had been charged, the preparation was warmed to  $40^{\circ}\text{C}$  over 1 h  
10 then kept at this temperature for another 2 h. Reaction progress was closely  
monitored by HPLC. As soon as Example 7 had all been consumed, the  
halogenation was quenched with 2% aqueous sodium sulphite (200 mL). The  
organic phase was washed with water (250 mL) and saturated brine (250 mL)  
prior to a polish filtration. Wet ethyl acetate was then distilled out to leave a  
15 dry 25% w/v solution of the product. The concentrate was seeded just below  
boiling, and diluted slowly with n-heptane (963 mL), once crystal growth had  
become apparent. Further crystallisation occurred during cooling to  $20^{\circ}\text{C}$  over  
4 h. Filtration of the resulting slurry afforded the title compound which was  
washed with 2:1 heptane: ethyl acetate (150 mL) and heptane (150 mL)  
20 before being dried *in vacuo* at  $40-45^{\circ}\text{C}$  (m.p.  $192.5-195^{\circ}\text{C}$ , 147.8g, 92.3%).

#### **Method C**

Intermediate 13 (14.4 g), Intermediate 5 (6.47 g) and absolute ethanol (140  
mL) were heated to  $40-45^{\circ}\text{C}$  and stirred out under nitrogen. LC monitoring  
showed the reaction to be complete after 12 h, whereupon triethylamine (10  
25 mL) was added and the mixture stirred for 0.5 h. After removal of solvent *in*  
*vacuo* ( $40-50^{\circ}\text{C}/50-100$  mBar), the residual orange-red paste (31.1g) was  
partitioned between ethyl acetate (150 mL) and water (100 mL). The aqueous  
phase was back-extracted with ethyl acetate (50 mL) and then the combined  
organic layers were distilled at atmospheric pressure to leave 3 volumes  
30 solvent with respect to the theoretical yield of product. The concentrated  
solution was seeded at  $75^{\circ}\text{C}$  and then heptane (140 mL) added *via* a syringe  
pump over 2 h, whilst maintaining this temperature. With most of the product  
crystallised, the mixture was cooled to  $20^{\circ}\text{C}$  and held for 1 h prior to filtration.  
Following heptane washes (2 x 50 mL) and drying at  $60^{\circ}\text{C}$  to constant weight,

the crude product was obtained as a pale orange solid [17.9g, 95.1% yield; LC 93.8% PAR, 91.2%w/w assay (*versus* an analytical specimen) => 86.7% active ingredient yield].

Acetyl chloride (1 mL) was added cautiously to stirred ethanol (50 mL) with exclusion of moisture. This solution was then added to a stirred suspension of  
15 the Intermediate 11 (24.0 g) and Intermediate 5 (12.0 g) in ethanol (200 mL) and the whole heated to 60°C under nitrogen for 2 h. Ethanol was removed *in vacuo* and the residue taken up in ethyl acetate (300 mL). The latter solution was washed with 5% sodium hydroxide solution (100 mL) followed by water (2 x 50 mL). Some tarry material was cut away with the aqueous phases. The  
20 organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and its volume reduced to approximately 100 mL, crystallisation of the product occurred after seeding. Sulphuryl chloride (13.6 g) was added drop-wise to diisopropyl disulphide (25.0 g) in tetrahydrofuran (THF, 150 mL) at 0-5°C under nitrogen. After

stirring out for 30 minutes, the resulting isopropyl sulphenyl chloride preparation was introduced slowly, from a graduated dropping funnel, to a solution of Example 9 (30.0 g) in THF (500 mL), held at the same temperature. Conversion to product was complete after 85 mL of the stock solution had been charged. The reaction was quenched with 10% sodium bicarbonate solution (175 mL) and the layers separated. The aqueous phase was extracted with ethyl acetate (100 mL), and the combined organic solutions then washed with saturated brine (100 mL).
